Scientific significance

The agri-food industries and the industry of medicinal and aromatic plants (MAP) generate huge amounts of plant waste, posing a serious environmental problem due to improper disposal. In the 21st century, society and industries are consistently committed to reducing residue loads through recovery and valorization of this biomass, with the aim to generate economic, social, and environmental benefits. This biomass can serve as a source for bioactive compounds, biosorbents, animal feed, biofuels, biogas production, biopesticides, enzyme synthesis, and soil improvement. Recycling and transforming this biomass into value-added products can contribute to sustainable development. Our goal is to present various traditional and innovative approaches adopted to valorize this natural and residual biomass, along with the newly advanced technologies in this field outlining the key strategies, presenting recent advancements, and promising approaches for the comprehensive exploitation of natural and residual plant biomass. The seminar encourages and invites high-quality contributions describing original data across all seminar subject areas.

Subject areas

1. Bioactive molecules, biological activities and molecular modelling
2. Microbial and industrial biotechnology
3. Agriculture and agri-food
4. Environment and health
